

Study 1 — Last-Speaker-Holds reproduces the standard turn-taking representation

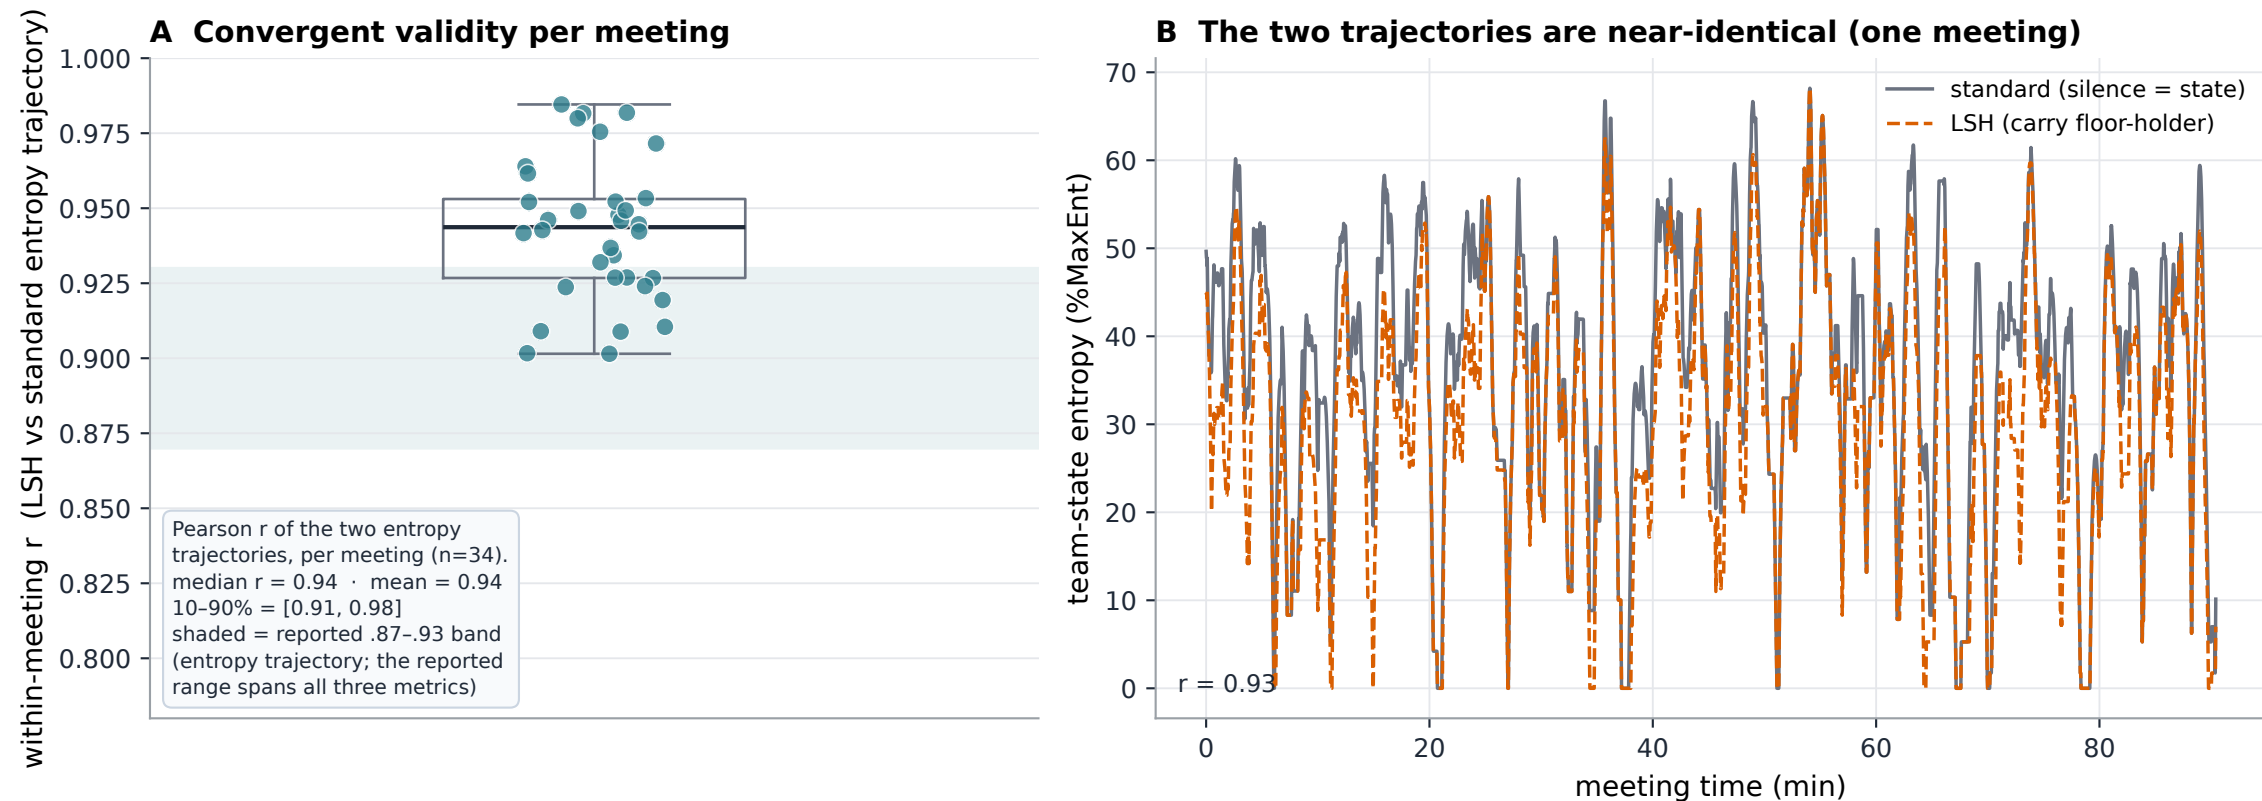

Figure 1. Convergent-validity check for the LSH representation. (A) Within-meeting correlation between the %MaxEntropy trajectory computed on the standard representation (silence kept as its own state) and on LSH (the last floor-holder carried forward through gaps); the two agree closely (reported $r \approx .87\text{--}.93$). (B) A representative meeting: the trajectories are visually near-identical. LSH is therefore adopted as a faithful, simpler substrate throughout. Unit = meeting ($n = 34$).
