

Study 2 — Reorganization is an endogenous, supra-autoregressive continuum with symmetric geometry

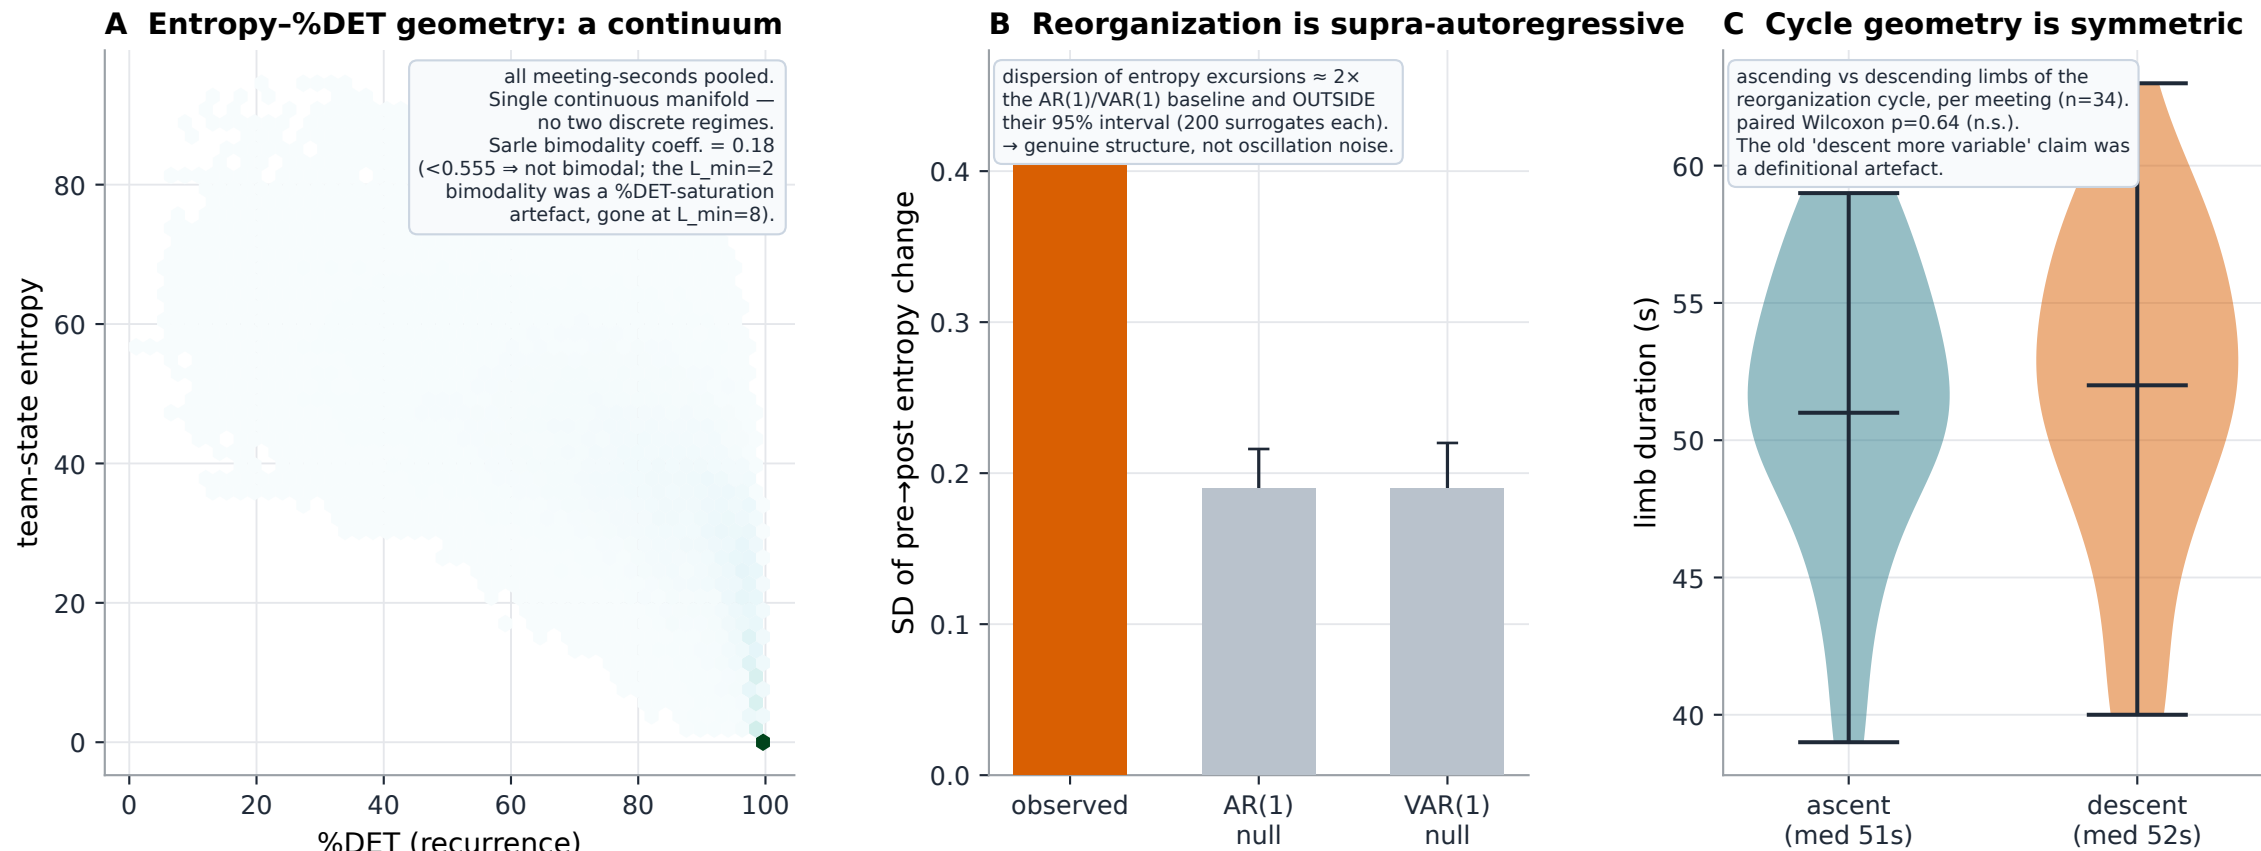

Figure 2. (A) Pooled across all meeting-seconds, entropy and %DET form one continuous manifold — not two discrete coordination regimes (Sarle bimodality coefficient below the 0.555 threshold; the earlier bimodality was a %DET-saturation artefact removed by $L_{\min}=8$). (B) The dispersion of pre→post entropy excursions at reorganization is $\sim 2\times$ and outside the 95% interval of AR(1) and VAR(1) surrogates (200 each) — genuine structure beyond trivial oscillation. (C) Ascending and descending limbs of the cycle are symmetric (paired Wilcoxon, n.s.).
