

Study 7 — Anatomy of a reorganization event: a redistribution of the speaking floor (F1→F2)

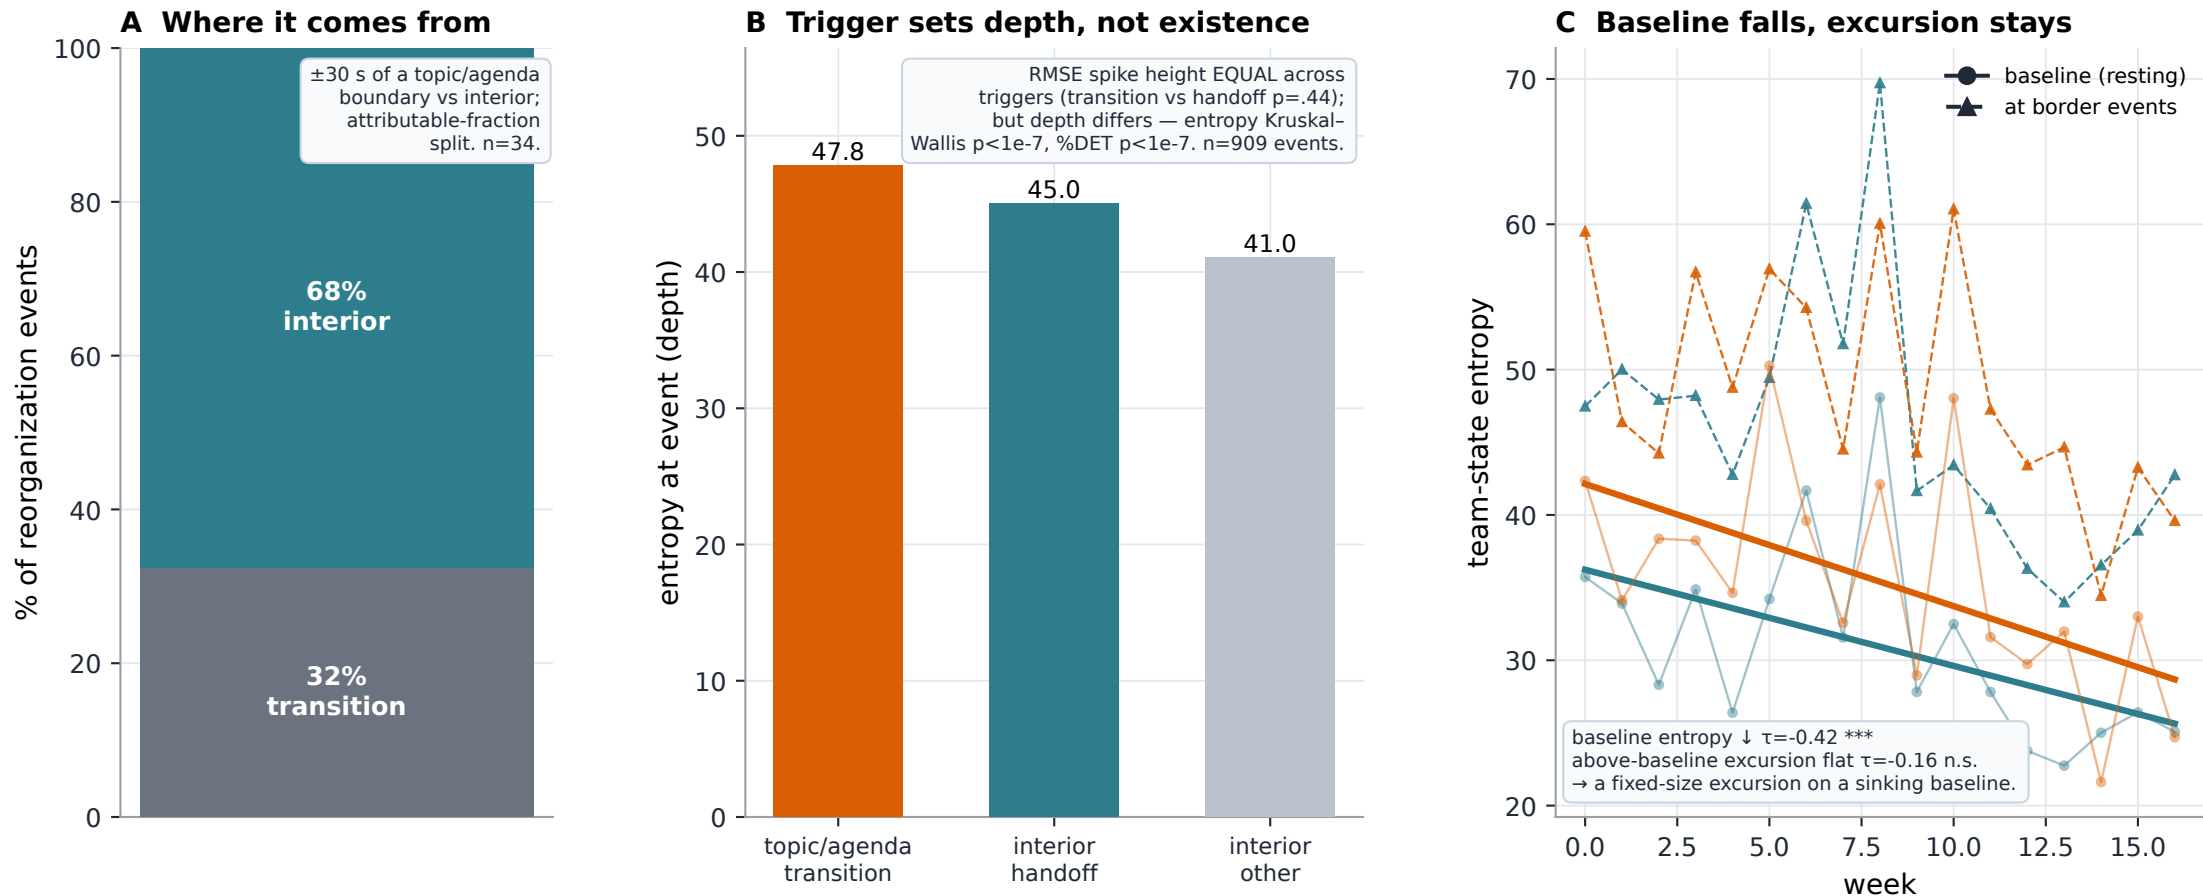

Figure 7. A reorganization event is a redistribution of the speaking floor. (A) ~1/3 is locked to topic/agenda transitions, ~2/3 is endogenous (handoffs/openings mid-topic). (B) The trigger does not determine whether a reorganization occurs (equal RMSE-prediction-error spike) but sets its depth. (C) Over 26 weeks the resting baseline entropy falls (consolidation) while the reorganization's above-baseline excursion is invariant — a stereotyped event riding a sinking baseline.
