

Study 9 — Who initiates reorganization? Talk-time explains it; a weak, definition-dependent drift toward the facilitator

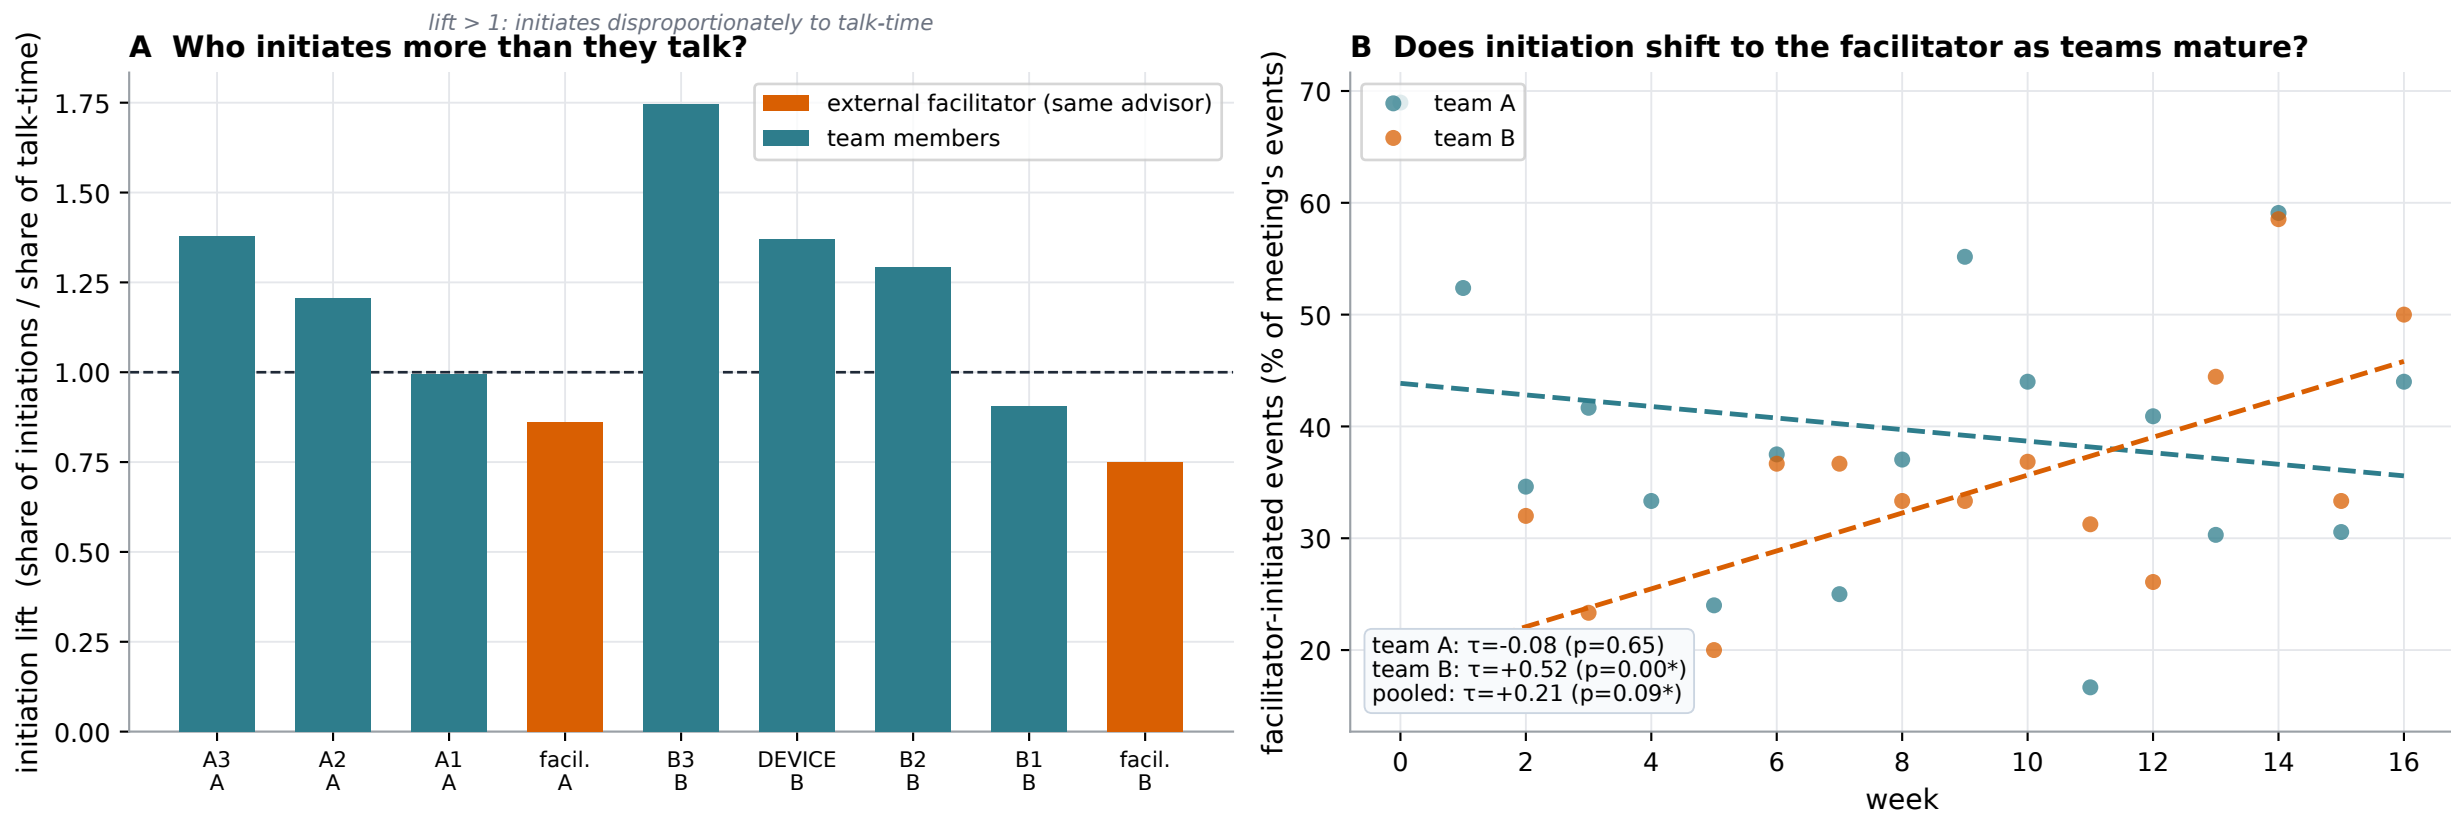

Figure 9. (A) Initiation lift (*init_primary* definition): the least-talkative member (S5) initiates far more than their talk-time predicts in both teams; the facilitator's lift is close to 1 (roughly proportional to talk-time). (B) Facilitator-initiated share rises modestly with week in team B ($\tau = +.41$, $p = .02$) but not team A (*n.s.*); pooled $\tau = +.27$, $p = .03$ — a weak, definition-dependent trend (null for the *init_question* definition), reported honestly, not as a robust finding.
