

Study 8 — Reorganization dynamics do not predict meeting-level outcomes at this sample size (n = 29-34)

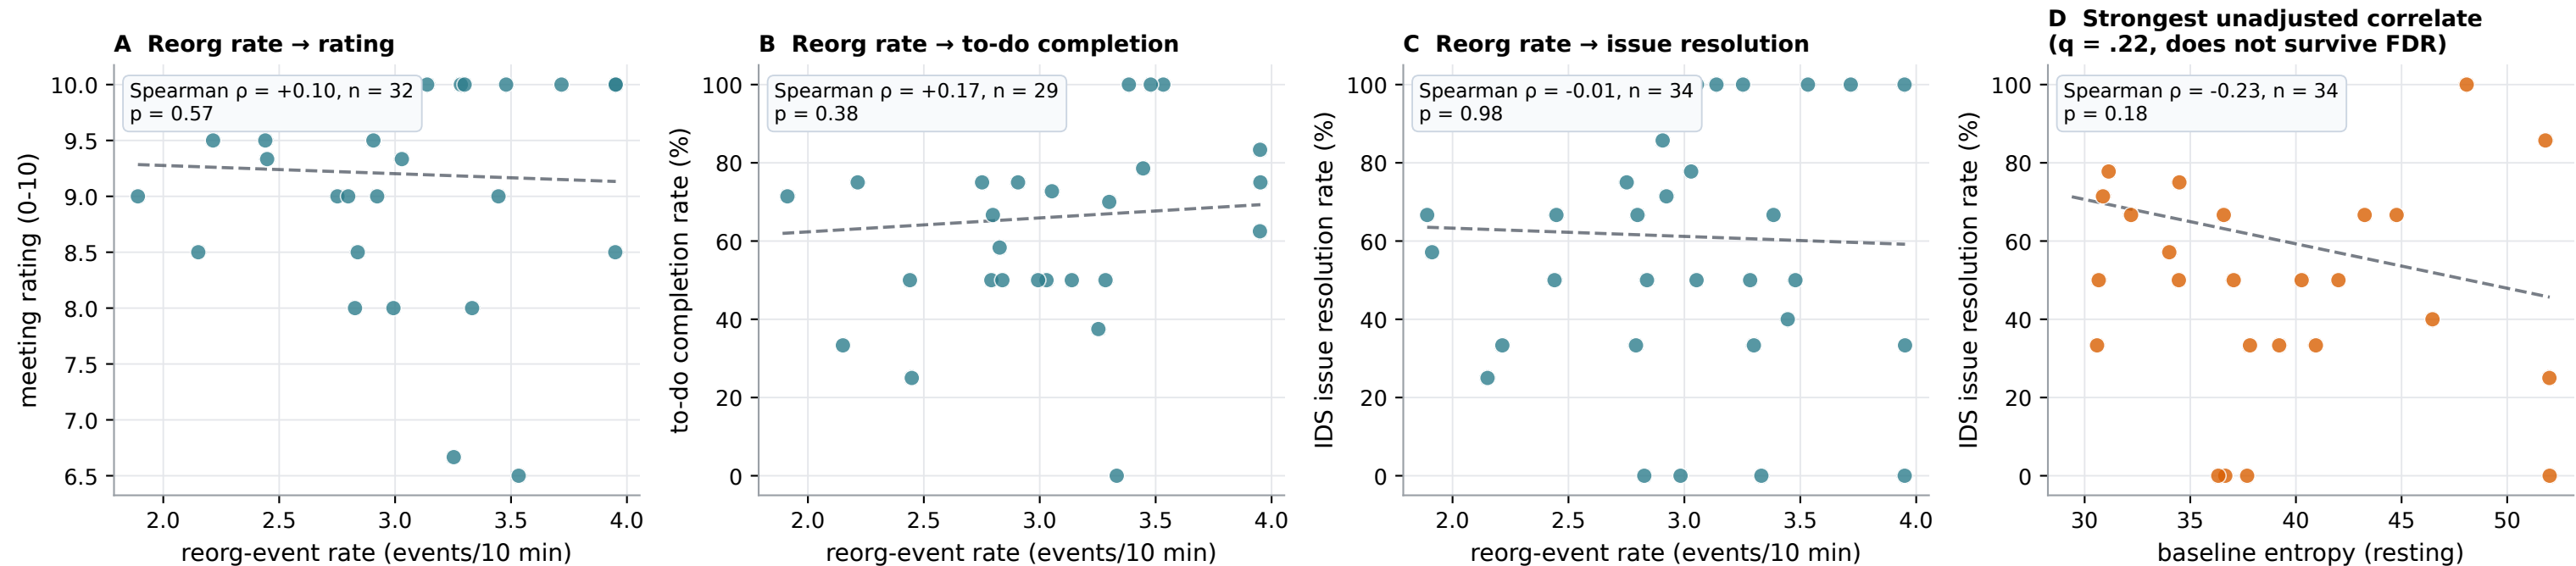

Figure 8. (A-C) The direct adaptive-function proxy (reorg-event rate) is null across all three outcomes (all $|p| < .15$, n.s.). (D) The single largest unadjusted correlation in the whole predictor x outcome grid (14 predictors x 3 outcomes, BH-FDR within each outcome family) — flagged for transparency and future work, not reported as a finding: it does not survive correction ($q = .22$).
