

Study 4 — Reorganization is the floor opening (Edelsky F1 → F2)

floor CONCENTRATION
high when stable (F1);
drops at reorganization

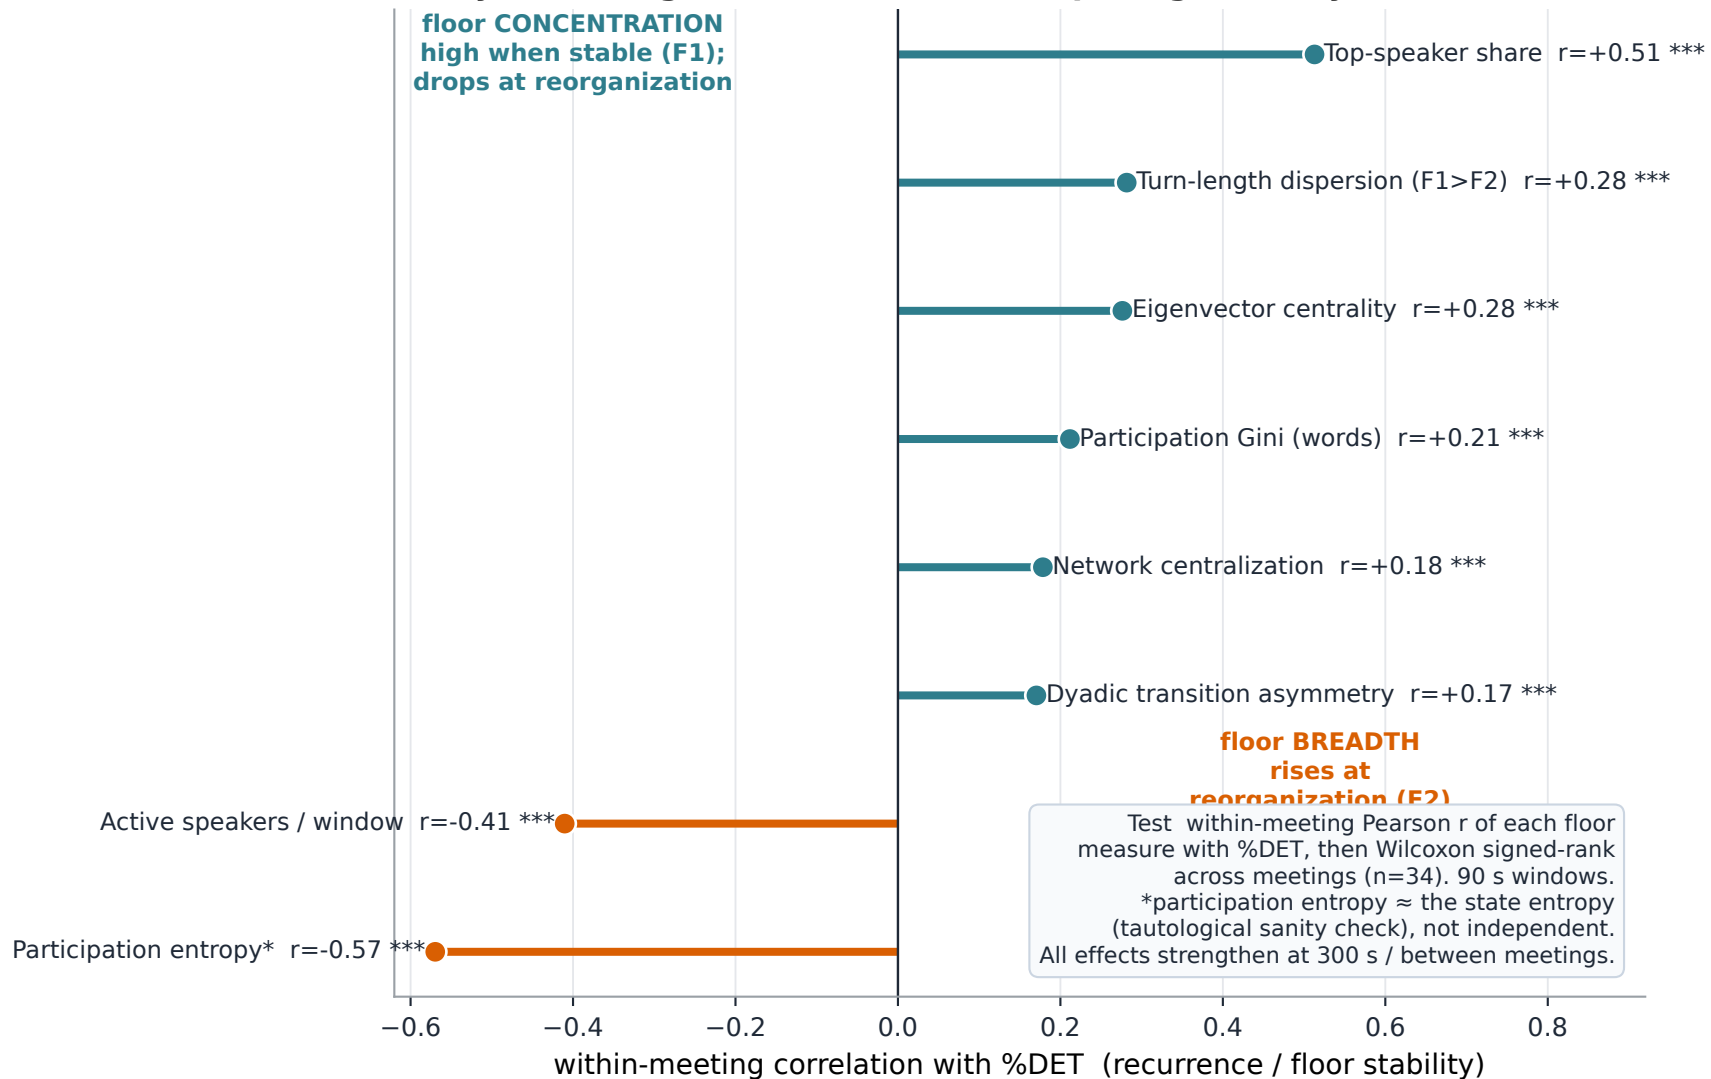

Figure 4. Casting the reorganization metrics in the vocabulary of the conversational floor (Edelsky 1981): measures of floor concentration — one dominant, central speaker (F1) — correlate positively with %DET (stable stretches), while floor breadth rises as %DET falls. Reorganization is the floor equalizing and de-centralizing (F1→F2). Bars = mean within-meeting r with %DET; * $p < .05$, ** $p < .01$, *** $p < .001$ (Wilcoxon, $n=34$).
