

Study 5 — Teams consolidate over 26 weeks (replicated across two teams, three lenses)

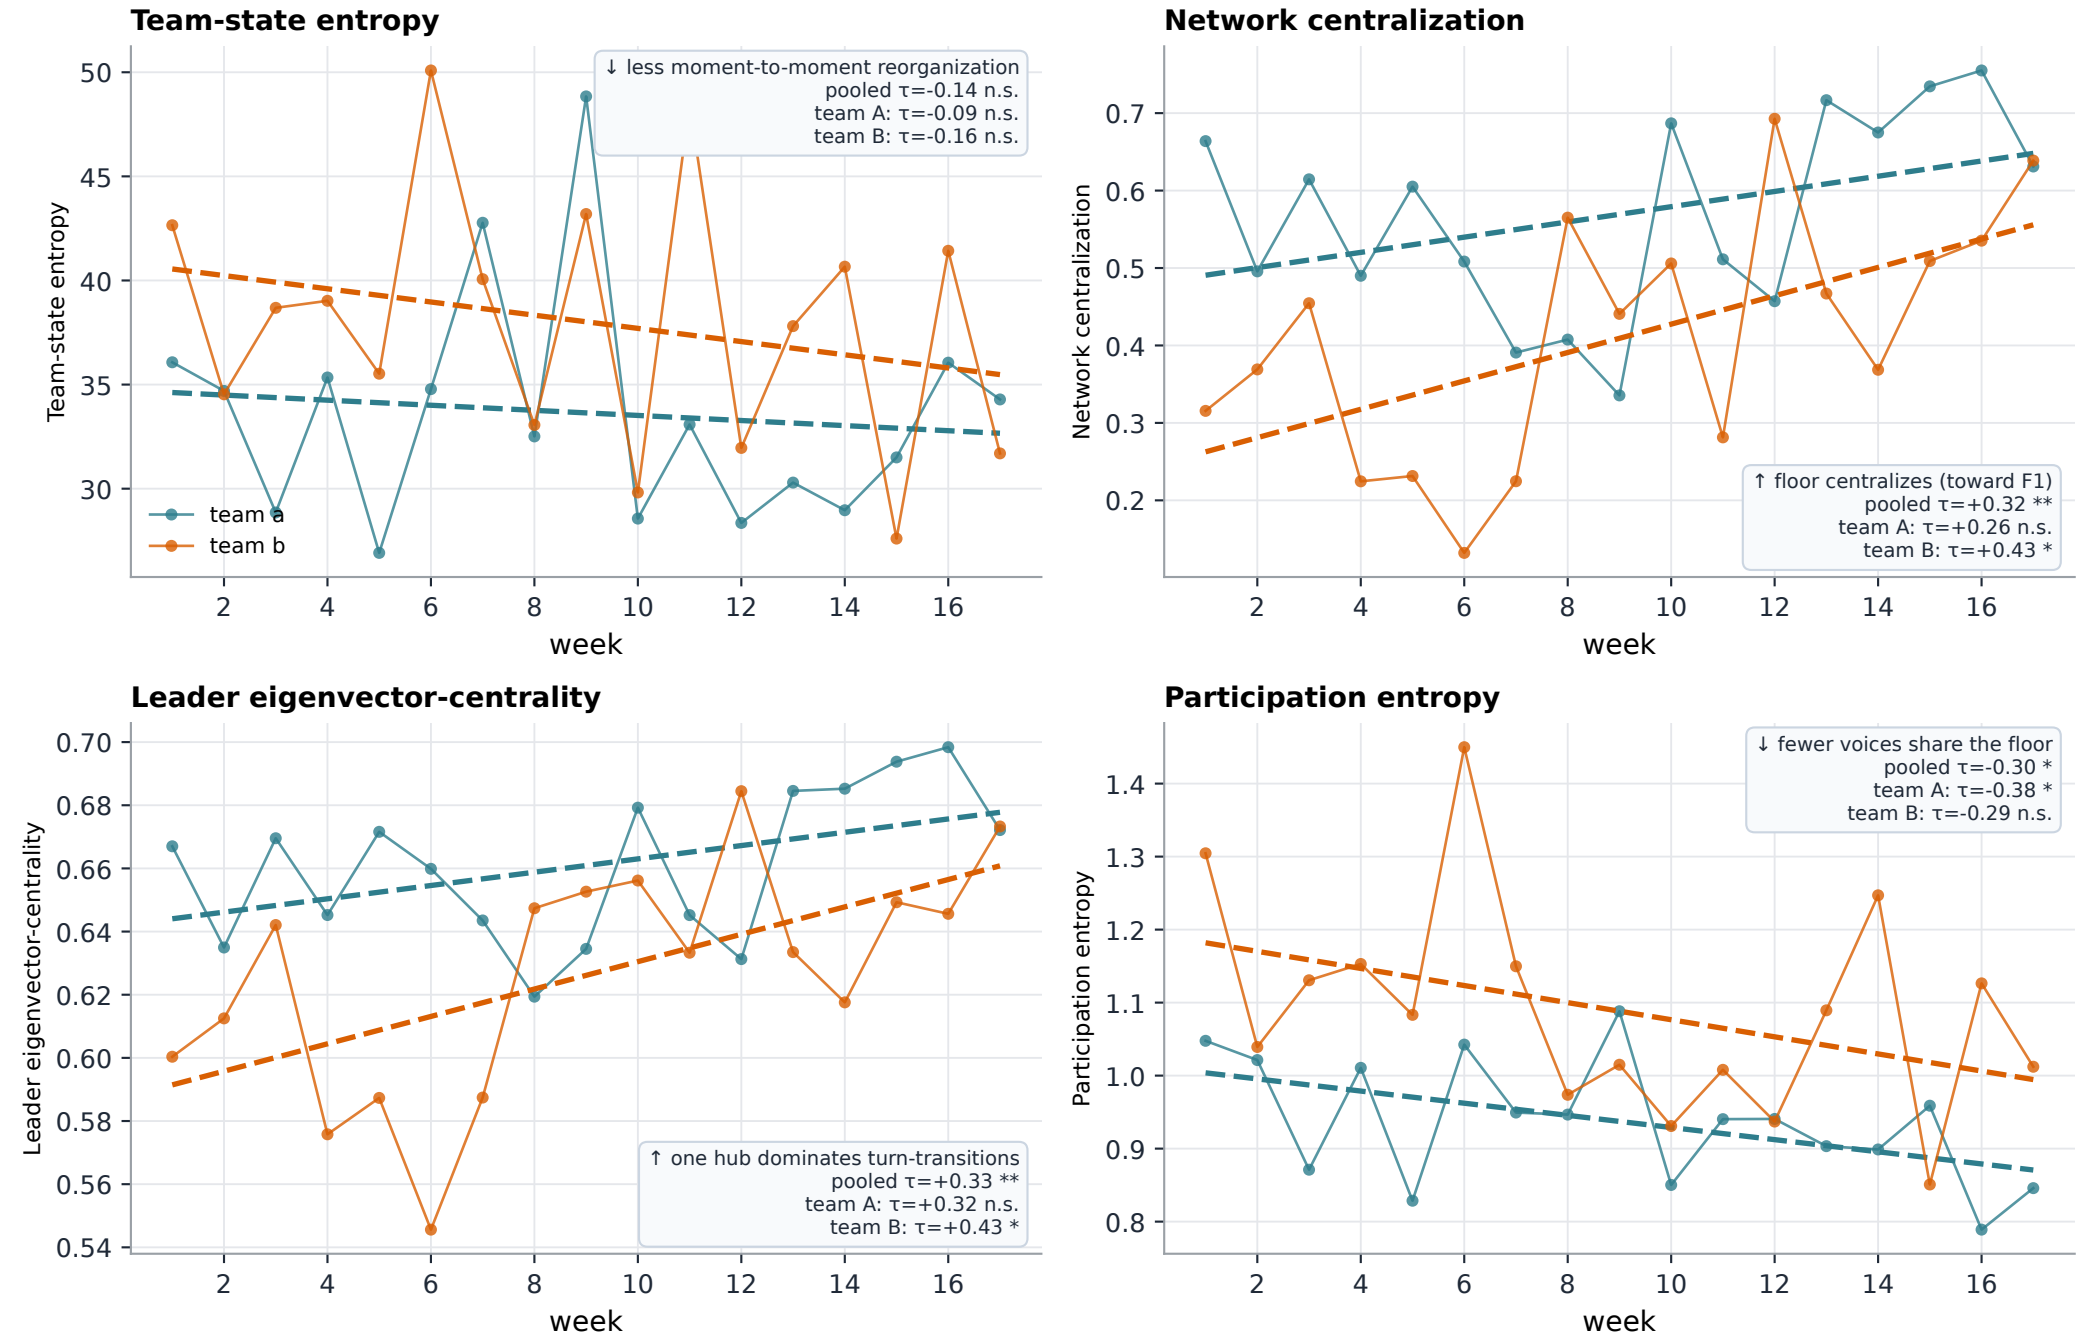

Figure 5. Across ~17 weekly meetings per team, dynamics (team-state entropy ↓) and floor structure (network centralization ↑, leader eigenvector-centrality ↑, participation entropy ↓) all move toward a fixed, leader-centric operating point with less moment-to-moment reorganization — consolidation/routinization, replicated across both teams. Trends are Mann-Kendall (Kendall τ), pooled and per team; dashed = OLS fit; * $p < .05$, ** $p < .01$, *** $p < .001$. Unit of inference = meeting ($n = 34$).
